The present sequence is a fusion protein construct CD39-L4-2/3, comprising the human CD39-L4 N-terminal region and soluble CD39 protein. CC comprising the human CD39-L4 N-terminal region and soluble CD39 protein. CD39-L4 is a secreted apyrase, belonging to the CD39 family. Soluble CD39 cc is constructed by removal of N- and C-terminal transmembrane domains. It retains the capacity to metabolise ATP and ADP at relevant concentrations and the ability to block and reverse ADP-induced platelet activation and crecuminant, including platelet aggregation. Soluble CD39 polypeptides are useful for inhibiting angiogenesis. It is useful for the treatment of unstable angina, myocardial infarction, stroke, coronary artery disease or injury, atherosclerosis, peripheral vascular occlusion, precelampsia, coronary and cerebral ischaemia, thrombotic disorders including lung, peripheral and cerebral artery thrombosis, intracardiac and venous coronary and cerebral artery thrombosis, intracardiac and venous composis, coagulopathy, deep venous thrombosis (DY), pulmonary composis, coagulopathy, deep venous thrombosis (DY), pulmonary composis, coagulopathy, deep venous thrombosis (DY), pulmonary compositing thrombus formation or reformation, occlusion, reocclusion, cocclusion, occusion, coccusion, cocclusion, cocclusion, cocclusion, co
                        New soluble CD39 polypeptides having apyrase activity, useful for inhibiting angiogenesis and treating unstable angina, myocardial infarction, stroke, coronary artery disease or injury.

The present sequence is a fusion construct of human soluble CD39 encoded by CD39-L4-2 and CD39-L4-3 constructs. CD39-L4 is a secreted apyrase belonging to the CD39 family. The fusion construct is used for the captacity of soluble CD39 in CHO (chinese hamster ovary) cells. Soluble CD39 retains the capacity of wildtype CD39 to metabolise ATP and ADP at physiologically relevant concentrations as well as the ability to block and reverse ADP-induced platelet activation and recruitment including platelet aggregation. This is used in the treatment of unstable angina, myocardial infarction, stroke, coronary artery disease or injury, atherosclerosis, peripheral vascular occlusion, corpusation in the peripheral activation in the present including current ischaemia and cerebral ischaemia, a thrombotic disorder including coronary artery thrombosis, cerebral artery thrombotic thrombosis, thrombosis, carebral artery thrombosis, thrombosis, venous thrombosis, thrombosis, carebral artery thrombosis, thrombosis, carebral artery thrombosis, thrombosis, carebral artery thrombosis, thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral and carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral and carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral artery thrombosis, carebral artery carebral artery t ö thrombosis, thrombosis, coagulopathy, deep venous thrombosis (DVT), pulmonary embolism (PE), transient ischaemic attack. Soluble CD39 is also useful for preventing thrombus formation or reformation, occlusion, reocclusion, stenosis or restenosis of blood vessels or stroke Gaps ö 99.9%; Score 2430; DB 3; Length 476; 100.0%; Pred. The present sequence is a fusion protein construct CD19-L4-1, comprising the human CD39-L4 N-terminal region and soluble CD39 protein. CD39-L4 is a secreted apprase, belonging to the CD39 fundle CD39 is constructed by removing the N- and C-terminal transmembrane domains. It retains the capacity to metabolise ATP and ADP at relevant concentrations and the ability to block and reverse ADP-induced platelet activation and recruitment, including platelet agregation. Soluble CD39 polypeptides recruitment, including platelet aggregation. Soluble CD39 polypeptides are useful for inhibiting angiogenesis. It is useful for the treatment of unstable angina, myocardial infarction, stroke, coronary atterogelerosis, peripheral vascular occlusion, preeclampsia, compolism, platelet-associated ischaemic disorders including lung, coronary and cerebral ischaemia, thrombosis intracardiac and venous thrombosis, coagulopathy, deep venous thrombosis (DVT), pulmonary corpusation (PS) and transient ischaemic attack. Soluble CD39 is also useful for preventing thrombus formation or reformation, occlusion, reocclusion, stenosis or restenosis of blood vessels or stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                140
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 180

```

Inhibiting platelet activation and recruitment, useful for treating a mammal suffering from unstable angina, myocardial infarction, stroke, coronary artery disease or injury, comprises administering soluble CD39 polypeptides.

Claim 6; Page 89-91; 118pp; English.

The present sequence is a fusion construct of human soluble CD39 encoded by CD39-L4-1 construct. CD39-L4 is a secreted apyrase belonging to the CD39 family. The fusion construct is used for the expression and activity of soluble CD39 in CHO (chinese hamster ovary) cells. Soluble CD39 in CHO (chinese hamster ovary) cells. Soluble CD39 retains the capacity of wildtype CD39 to metabolise ATP and ADP at physiologically relevant concentrations as well as the ability to block physiologically relevant concentrations as well as the ability to block and reverse ADP-induced platelet activation and recruitment including platelet aggregation. This is used in the treatment of unstable angina, myocardial infarction, stroke, coronary attery disease or injury, atherosclerosis, peripheral vascular occlusion, preeclampsia, embolism, platelet-associated ischaemic disorder including lung ischaemic, coronary ischaemia and cerebral ischaemia, thrombosis, intracardiac thrombosis, peripheral artery thrombosis, thrombosis, intracardiac thrombosis, carperty thrombosis, carbon thrombosis, thrombosis, capalopathy, deep venous thrombosis, thrombosis, thrombosis, capalopathy, deep venous thrombosis, thrombosis, capacity also active thrombosis or capalopathy deep venous thrombosis, thrombosis, capacity for preventing thrombus formation or reformation, occlusion, reocclusion, stenosis or restenosis of blood vessels or stroke

   pancreatic (AAW04339) ATPDases have been partially sequenced. The sequences have been found to be highly homologous to a human lymphoid cell activation antigen designated CD39 (Maniszenski et at. (1994). J. Immunol.: 3574-3583). The complete sequences of the ATPDases types I and II have not been obtained yet. Assuming that the CD39 gene product is an ATPDase type II, the use of CD39 in the reduction of platelet aggregation and of thrombogenicity may be contemplated, as well as a process of making ATPDases using the CD39 sequence (AAT38516)

                                                                                                                                                                                                                                                                                                                                                                                                                                                           Non-human transgenic or somatic recombinant mammals, whose cells contain a heterologous DNA encoding a polypeptide (especially human CD39 protein) having AFP-diphosphohydrolase activity under cellular activating conditions is claimed. In particular the animal is a pig and its colditions is claimed. In particular the animal is a pig and its chuman CD39 is also useful for genetically modifying a mammalian cell to render it less susceptible to an inflammatory or immunological stimulus and platelet aggregation. The modified cells can be used to prevent or alleviate a thrombotic condition. The present sequence is that of the human CD39 protein and was disclosed in J.Immunol. 153 (8) (1994) 3574-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      211
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   251

It is derived from a human B cell line cDNA library, referred to as MP-1. Soluble CD39 is constructed by removing the N- and C-terminal transmembrane domains. It retains the capacity to metabolise ATP and ADP at relevant concentrations and the ability to block and reverse ADP-induced platelet activation and recruitment, including platelet aggregation. Soluble CD39 polypeptides are useful for inhibiting angiogenesis. It is useful for the treatment of unstable angina, myocardial infarction, stroke, coronary artery disease or injury, atherosclerosis, peripheral vascular occlusion, preeclampsia, embliem, platelet-associated ischement disorders including lung, coronary and cerebral ischement, thrombotic disorders including coronary, peripheral and cerebral artery thrombosis, intracardiac and venous
                                                                                                                                                                Soluble CD39; human; apyrame activity; platelet activation; inhibitor; unstable angina; myocardial infarction; stroke; coronary artery diseame; atherosclerosis; peripheral vascular occlusion; preeclampsia; embolism; platelet-associated ischaemic disorder; thrombotic disorder; reocclusion; coagulopathy; deep venous thrombosis; DVT; pulmonary embolism; PE; thrombus formation; occlusion; stenosis; restenosis; anglogenesis; antianginal; cerebroprotective; antiarteriosclerotic; anticoagulant;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      present sequence is the human soluble CD39 protein, a cell surface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New soluble DD39 polypeptides having apyrase activity, useful for inhibiting angiogenesis and treating unstable angina, myocardial infarction, stroke, coronary artery disease or injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gimpel SD;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   227. 229

The present sequence is the human CD39 polypeptide. The present sequence or its active fragment may be administered to treat or prevent stroke in a subject susceptible to intracranial haemorrhaging or an ischaemic disorder. The CD39 polypeptide inhibits ADP-mediated platelet aggregation or leukcoyte accumulation and/or ATP by increasing ADP catabolism to the subject. It is useful for treating or preventing stroke, thrombocic disorders and ischaemic disorders such as peripheral vascular disorder, pulmonary embolus, venous thrombosis, myocardial infarction, transient ischaemic attack, unstable angina, reversible ischaemic neurological deficit and sickle cell anaemia. It is also useful for treating or preventing a stroke disorder in a subject undergoing heart surgery, lung surgery, spinal surgery, brain surgery, vascular surgery, abdominal surgery, or organ transplantation surgery

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is soluble CD39 having apyrase activity. Soluble CD39 retains the capacity of wildtype CD39 to metabolise ATP and ADP at physiologically relevant concentrations as well as the ability to block and reverse ADP-induced platelet activation and recruitment including platelet aggregation. This is used in the treatment of unstable angina, myocardial infarction, strock, coronary artery disease or injury, categoris, peripheral vascular occlusion, preeclampsia, embolism, platelet-associated ischaemic disorder including lung ischaemia, oronary ischaemia and cerebral ischaemia, thrombotic disorder including coronary ischaemia and cerebral ischaemia, thrombotis, intracardiac thrombosis, peripheral artery thrombosis, intracardiac thrombosis, peripheral artery thrombosis, venous thrombosis, intracardiac thrombosis, coagulopathy, deep vanous thrombosis, lung, pulmonary embolism (PB), transient ischaemic attack. Soluble CD39 is also useful for preventing thrombus formation or reformation, occlusion, reocclusion, stenosis or restenosis of blood vessels or stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SKFVQKVNEIGIYLTDCMERAREVIPRSQHQETPVYLGATAGMRLLRMESEELADRVLDV 131

The invention relates to a conjugate (I) comprising an enzyme and a biodegradable polymer, where (i) enzymatic activity of the enzyme is bigher relative to that of the enzyme in the absence of the biodegradable polymer, or (ii) the half life of the enzyme is longer than that of the enzyme is longer than that of the enzyme in the absence of the polymer. The enzymatic activity (i) is at least 10 (preferably at least 100) times higher in the presence of the polymer. The enzyme is a multimeric, soluble and/or extracellular enzyme, preferably an apyrase, especially a soluble form of CD39 and catalyzes hydrolysis of mucleoside diphosphate. The conjugate can be used to treat diseases relating to abnormal levels of extracellular nucleotides or abnormal aggregation of platelete, particularly cardiovascular disease, cancer, sepsis or a disease related to graft transplant. (I) is also used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        311

The invention relates to novel CD39-like polypeptides (CD39-like nucleotide triphosphatase; NTPase) and nucleic acid molecules encoding such polypeptides. CD39-like polymucleotides may be used as hybridisation probes, PCR primers and in chromosome and gene mapping. Polypeptides of the invention may be used as molecular weight markers, as food supplements, in generating an antibody that specifically binds the polypeptide, as anti-thrombotic or anti-tissue graft rejection agents, or for regulating ATP neurotransmission in smooth muscle, peripheral ganglis or brain. Sequences of the invention are useful in modulating ecto-ATPase activity and for identifying compounds that modulate ecto-ATPase activity. The present sequence is human CD39 protein, a member of the CD39-like protein family. Note: This sequence is stated to be the same as
                                                                                                                                                                                                                                                                                                                                                        CD39-like protein; gene mapping; molecular weight marker;
food supplement; anti-thrombotic; anti-tissue graft rejection agent;
ATP neurotransmission; ecto-ATPase activity; nucleotide triphosphatase;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a method of treating cardiovascular disease in a subject, comprising administering an IL-17, IL-18, 4-IBB, CD30 or OX40 antagonist. The IL-17, IL-18, 4-IBB, CD30 or OX40 antagonist. The IL-17, IL-18, 4-IBB, CD30 or OX40 antagonists are useful for treating cardiovascular disorders, e.g. (chronic immune) myocarditis, congestive heart failure, aneurysms, angina, embolism, restenosis, ischaemia or thrombocytopenic purpura. T present sequence is a polypeptide used in the exemplification of the

The present invention relates to CD39-like polypeptide and its encoding polynucleotide. The invention is useful for preventing, treating or polynucleotide. The invention is useful for preventing, treating or ameliorating autoimmune deficiency disorders including connective tissue disease, multiple sclerosis, systemic lupus erythematosus, rheumatoid arthritis, autoimmune pulmonary inflammation, Guillain-Barre syndrome, autoimmune thyroiditis, insulin dependent diabetes mellitus, myasthenia gravis, graft-versus-host disease or autoimmune inflammatory eye disease, allergic disorders including asthma and other respiratory problems, myeloid or lymphoid cell deficiencies, periodontal diseases and other tooth repair processes, inflammatory conditions including inflammatory chowel disease and Crohn's disease, leukaemias and nervous system disorders. The invention is also useful as an anticoagulant for inhibiting platelet aggregation, food supplement, anti-tissue graft rejection agents, for regulating neurotransmission by ATP in smooth muscle, peripheral ganglia or brain and in gene therapy. The present sequence is a human CD39 protein. Note: This sequence is stated to be the same at that shown as SEQ ID 13 in sequence listing, however these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   LENTSYCPYSQCAFNGIFLPPLQGDFGAFSAFYFVMKFLNLTSEKVSQEKVTEMMKKFCA 371

The invention is useful in treating cancer, leukaemia and related disorders such as acute lymphocytic leukaemia, acute myelocytic leukaemia, and chronic leukaemia, autoimmune disorders such as multiple sclerosis, rheumatoid arthritis, Guillain-Barre syndrome, insulin dependent diabetes calliain, myasthenia gravis and graft-versus-host disease, allergic disorders such as asthma, respiratory disorders, inflammatory disorders cuch as septic shock, systemic inflammatory response syndrome (SIRS) and crohn as septic shock, systemic inflammatory response syndrome (SIRS) and crohn as septic shock, systemic inflammatory response syndrome (SIRS) and ischaemia, Parkinson's disease, Alzheimer's disease, Huntington's chorea, systemic lupus erythematosus, human immunodeficiency virus-associated systemic lupus erythematosus, human immunodeficiency virus-associated cytamin BlZ deficiency, folic acid deficiency, wernicke disease, tobaccolalcohol amblyopia and Marchfafava-Bignami disease. The invention also has contamined thrombolytic acid deficiency, serve as nutritional supplements and modulates ecto-ATPase activity. Serve as nutritional supplements and modulates ecto-ATPase activity. The invention acts as a cytostatic gent and is useful in immunotherapy. The present sequence is human CD3 protein. Note: This sequence is described in the specification as being
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        131

                                                                                                                                                                                                                                                                                                                                                                           Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a CD39-like polypeptides and the encoding polynucleotides. The CD3914 polynucleotide is useful as encoding polynucleotides. The CD3914 polynucleotide is useful as hybridisation probes, as primers for PCR, for chromosome or gene mapping, in the recombinant production of protein, and in generation of antisense DNA or RNA. The protein of the invention is used as molecular weight markers, and as food supplements and for modulating ecto-ATPases activity. The invention is useful for preventing, treating or ameliorating a medical condition, e.g. multiple sclerosis, theumatoid arthritis, autoimmune thyroiditis, diabetes mellitus, myasthenia gravis, autoimmune inflammatory evel disease, osteoporosis, osteoarthritis, autoimmune thyroiditis, diabetes mellitus, myasthenia gravis, altoimmune inflammatory evel disease, osteoporosis, osteoarthritis, cluckaemia or nervous system disorders and in gene therapy. The present sequence is that shown as SEQ ID 13 in sequence listing, however these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 1,

Patent No. 6287837

GENERAL INFORMATION:

APPLICANT: BEAUDOIN, Adrien R.

APPLICANT: BEAUDOIN, Adrien R.

TITLE OF INVENTION: THEREOF AND PROCESS OF PRODUCING THEREOF BY RECOMBINANT

TITLE OF INVENTION: THERHOLOGY

TITLE OF INVENTION: THERHOLOGY

TITLE OF INVENTION: THERHOLOGY

TITLE OF INVENTION: ATP-DIPHOSPHOHYDROLASES-BEAUDOIN

FILE REFERENCE: ATP-DIPHOSPHOHYDROLASES-BEAUDOIN

CURRENT FILING DATE: 1998-01-02

BARLIER APPLICATION NUMBER: PCT/CA96/00223

BARLIER APPLICATION NUMBER: PCT/CA96/00223

Sequence 4, Application US/09905743B

Sequence 4, Application US/09905743B

Patent No. 6628423

GENERAL INFORMATION:

APPLICANT: Chadwick, Brian Paul

APPLICANT: Frischauf, Anna Maria

TITLE OF INVENTION: METHODS AND COMPOSITIONS RELATING TO CD39-LIKE POLYPEPTIDES AND PAUL REPERENCE: 28110/36120C

TITLE OF INVENTION: UNMBER: US/09/905,743B

CURRENT APPLICATION NUMBER: US/09/905,743B

CURRENT FILING DATE: 1999-01-29

NUMBER OF SEQ ID NOS: 32

SOFTWARE: Patentin version 3.1
